BRNO 2023

Bachelor's Thesis Assignment

148202

Institut: Department of Intelligent Systems (UITS)
Student: **Lapeš Zdeněk**
Programme: Information Technology
Specialization: Information Technology
Title: **Reinforcement Learning for Automated Stock Portfolio Allocation**
Category: Artificial Intelligence
Academic year: 2022/23

Assignment:

1. Study the state-of-the-art methods for automated stock portfolio allocation. Focus on the methods based on reinforcement learning and planning in Markov Decision Processes.
2. Experimentally evaluate selected open access tools for automated portfolio allocation including e.g. FinRL-Meta and identify their weak points.
3. Propose and implement improvements of a selected method/tool allowing to mitigate these weak points.
4. Using suitable benchmarks and datasets, perform a detailed experimental evaluation of the implemented improvements with the focus on the portfolio allocation returns.

Head of Department: Hanáček Petr, doc. Dr. Ing.

Beginning of work: 1.11.2022

Submission deadline: 10.5.2023

Approval date: 3.11.2022

Abstract

This thesis focuses on the design and implementation of a model capable of making decisions in a very fast-changing financial environment. It is based on the modern portfolio theory and reinforcement learning. In the first step, a simulation environment is created that allows testing various strategies. In the second step the agent is trained to try to achieve the maximum return. In the third step, the agent is tested on real data.

Abstrakt

Tato práce se zaměřuje na návrh a implementaci modelu schopných dělat rozhodnutí ve velmi rychle se měnícím finančním prostředí. Vychází z teorie moderního portfolia a posilovaného učení. V prvním kroku je vytvořeno simulační prostředí, které umožňuje testovat různé strategie. V druhém kroku je trénován agent, který se snaží dosáhnout maximálního návratu. V třetím kroku je agent testován na reálných datech.

Keywords

artificial intelligence, AI, reinforcement learning, stock portfolio allocation, modern portfolio theory, Q-learning, neural networks, stock market

Klíčová slova

umělá inteligence, AI, posilované učení, alokace akciového portfolia, moderní teorie portfolia, Q-learning, neuronové sítě, akciový trh

Chapter 1

Introduction

The portfolio allocation is a problem that has been studied for a long time. The problem is to find the optimal allocation of the portfolio, given a specific set of securities.

The portfolio management task is basically the most important to the finance institutions, like banks, hedge funds and asset management companies. It help traders understand the market and its risks.[1]

The portfolio allocation was widely studied in a standart ways, like the Markowitz portfolio theory[2, p. 4], the CAPM model and the Black-Litterman model.

The stock market is a wide and quick changing environment and people are emotionally based, which means, that behave based on their emotions and only a few people can do rational decisions. This could be problem, specifically when you need to decide based on what you know about given asset.

In this thesis, I will focus on the application of RL in the field of finance, specifically in portfolio allocation. The goal of portfolio allocation is to find the optimal portfolio of assets that maximizes the expected return for a given level of risk.[1]

Deep Reinforcement Learning (DRL) methods have been used in many different fields, such as robotics, video games, and finance. And studied how much a change in input would influence the output is important to understand what contributes to the decision making process of the DRL agents.[1]
